Excerpt: . . . is a permanent magnet, by turning its poles round the other way. The left-hand rule may also be applied to predict the direction of the induced currents in the experiments illustrated in Figs. 105-108. In Fig. . 105, think of the tuft of lines proceeding from the N. pole of the magnet, and the direction in which they cut the first turn of the coil. In Fig. 106, imagine an end view of the wires a b and c d; figure to yourself the circular lines spreading out from a b and collapsing again, when the primary or inducing circuit is respectively made and broken, and think of the direction in which they cut the wire c d. In Fig. 107, the lines of force due to coil A are practically the same shape as if A were a bar magnet; and having found the polarity of one end of A by one of the rules given in 106, A may be looked upon as a bar magnet. Then the direction of the currents induced in B may be predicted as in the case of the experiment illustrated in Fig. 105. When the coils are one within the other (Fig. 108), one may think of the lines spreading out from and collapsing into coil A when the circuit is respectively made and broken, and the direction in which these lines cut the outer coil B. In experiment (f), when the iron core is inserted, many...
